

ABSTRACT OF THE DISCLOSURE

- A system and method of processing a digital image for user assessment of an output image product intended to be generated using the digital image. The method comprises the steps of: (a) accessing the digital image using an imaging device having a viewing member; (b) selecting the output image product intended to include the digital image; (c) digitally modifying at least a portion of the digital image using the imaging device to produce a substantially accurate representation of at least a portion of the output image product; and (d) displaying, using the viewing member, for assessment by the user, the substantially accurate representation of the at least a portion of the output image product.
